

Soulprint

DESIGN TOKEN PACKAGE + CODE INSTALL GUIDE

Built from the Soulprint World Class Brand Book. The system is warm, vivid, enduring, heartfelt, artistic, and trustworthy.

Soulprint Navy #062A63 Trust	Cobalt Blue #0B63D1 Digital
Memory Teal #22D7E8 Fresh	Heart Pink #FF4198 CTA
Sunrise Coral #FF7A73 Story	Golden Light #FFC93D Joy
Soft Ivory #FFF8F1 Base	

Included: JSON tokens, CSS variables, Tailwind config, TypeScript helper, optional component utilities, examples, and this PDF guide.

1. What This Token System Covers

This package turns the brand book into code that can be dropped into a Next.js, React, and Tailwind CSS project. It keeps the product warm and emotional while giving the interface enough structure to feel premium and trustworthy.

- Brand colors from the color system: Soulprint Navy, Cobalt Blue, Memory Teal, Heart Pink, Sunrise Coral, Golden Light, and Soft Ivory.
- Typography roles from the typography system: signature display serif, editorial story serif, clean human sans, and light script accent.
- UI tokens for gradients, radius, shadows, focus rings, buttons, cards, and Soul Profile or Soulfie experiences.
- Installation paths for Tailwind, global CSS, Next.js app layout, and reusable React components.

Recommended naming

Use **Soul Profile** as the clearest primary product term. Use **Soulfile** as a warmer branded alternate when the moment is emotional, campaign-driven, or more poetic.

Required brand hierarchy

Soulprint - Memories Live On
Created by Chasdo Creative Worldwide LLC

Do not mix the parent company tagline into Soulprint product copy unless you are intentionally showing a parent-company endorsement area.

2. Color Tokens

Use navy for clarity and trust. Use the vivid accents with purpose so the experience feels alive, artistic, and heartfelt instead of sterile.

Token	Hex	Primary use
--sp-color-navy	#062A63	Primary anchor for headlines, body clarity, outlines, and trust.
--sp-color-cobalt	#0B63D1	Energetic digital accent for links, active states, and depth.
--sp-color-teal	#22D7E8	Freshness, optimism, focus rings, glow, and motion.
--sp-color-pink	#FF4198	Heart, love, primary CTAs, emotional highlights.
--sp-color-coral	#FF7A73	Story warmth, transitions, and memory moments.
--sp-color-gold	#FFC93D	Celebration, joy, sparkle, badges, and premium touches.
--sp-color-ivory	#FFF8F1	Primary warm background and refined page base.

Accessibility note

Use Soulprint Navy or Ink for long-form copy. Bright accent colors should create emotion and navigation cues, not carry entire paragraphs.

3. Typography Tokens

The typography should feel creative, elevated, clear, human, and emotionally expressive. The code package keeps the same hierarchy while using performance-safe web font loading.

Role	Font	Use
Signature Display	Cormorant Garamond Bold	Hero headlines, section titles, brand moments, emotional statements.
Editorial Story	Fraunces Regular and Italic	Quotes, founder notes, storytelling, memorial excerpts.
Human Sans	Plus Jakarta Sans Regular and Semibold	Body copy, navigation, UI labels, buttons, forms.
Soul Note Script	Caveat or Allura	Small handwritten notes and human touches. Use sparingly.

Next.js font loading

```
import { Cormorant_Garamond, Fraunces, Plus_Jakarta_Sans, Caveat } from
  "next/font/google";

const display = Cormorant_Garamond({ subsets: ["latin"], weight: ["700"], variable:
  "--font-soul-display" });
const story = Fraunces({ subsets: ["latin"], weight: ["400", "600", "700"], style:
  ["normal", "italic"], variable: "--font-soul-story" });
const sans = Plus_Jakarta_Sans({ subsets: ["latin"], weight: ["400", "500", "600",
  "700"], variable: "--font-soul-sans" });
const script = Caveat({ subsets: ["latin"], weight: ["400", "700"], variable:
  "--font-soul-script" });
```

4. Install The Files

Use this structure so brand tokens stay separate from feature code. It will save you pain later when the design system evolves.

```
src/  
  styles/  
    soulprint.tokens.css  
    soulprint.components.css  
  theme/  
    soulprint.design-tokens.json  
    soulprint.tokens.ts  
  
tailwind.config.ts  
app/  
  globals.css  
  layout.tsx
```

Step 1 - copy the files

```
mkdir -p src/styles src/theme  
cp soulprint.tokens.css src/styles/soulprint.tokens.css  
cp soulprint.components.css src/styles/soulprint.components.css  
cp soulprint.design-tokens.json src/theme/soulprint.design-tokens.json  
cp soulprint.tokens.ts src/theme/soulprint.tokens.ts
```

Step 2 - import the CSS

```
@tailwind base;  
@tailwind components;  
@tailwind utilities;  
  
@import "../styles/soulprint.tokens.css";  
@import "../styles/soulprint.components.css";
```

If globals.css lives inside a different folder, adjust the import path. Import these once at the global level.

5. Tailwind Setup

Merge the included `tailwind.config.ts` values into your existing config. Do not wipe out your current content paths or plugins.

```
theme: {
  extend: {
    colors: {
      soulprint: {
        navy: "var(--sp-color-navy)",
        cobalt: "var(--sp-color-cobalt)",
        teal: "var(--sp-color-teal)",
        pink: "var(--sp-color-pink)",
        coral: "var(--sp-color-coral)",
        gold: "var(--sp-color-gold)",
        ivory: "var(--sp-color-ivory)",
        ink: "var(--sp-color-ink)",
        muted: "var(--sp-color-muted)",
        line: "var(--sp-color-line)",
      },
    },
    fontFamily: {
      "soul-display": ["var(--sp-font-display)"],
      "soul-story": ["var(--sp-font-story)"],
      "soul-sans": ["var(--sp-font-sans)"],
      "soul-script": ["var(--sp-font-script)"],
    },
    boxShadow: {
      "soul-card": "var(--sp-shadow-card)",
      "soul-glow-pink": "var(--sp-shadow-glow-pink)",
      "soul-glow-teal": "var(--sp-shadow-glow-teal)",
    },
  },
}
```

Example usage

```
<section className="bg-soulprint-ivory bg-soul-ivory-aurora text-soulprint-navy">
  <p className="font-soul-sans uppercase tracking-widest text-soulprint-teal">
    Soulprint - Memories Live On
  </p>
  <h1 className="font-soul-display text-6xl leading-none">
    Build one beautiful Soulprint Home.
  </h1>
  <button className="rounded-full bg-soulprint-pink px-6 py-3 font-soul-sans font-bold
    text-white shadow-soul-glow-pink">
    Create a Soul Profile
  </button>
</section>
```

Restart the dev server after changing Tailwind config. Tailwind often needs a clean restart before new token classes appear.

6. Next.js App Router Setup

Use this in app/layout.tsx to load the font variables and metadata.

```
import type { Metadata } from "next";
import { Cormorant_Garamond, Fraunces, Plus_Jakarta_Sans, Caveat } from
  "next/font/google";
import "../globals.css";

const display = Cormorant_Garamond({ subsets: ["latin"], weight: ["700"], variable:
  "--font-soul-display" });
const story = Fraunces({ subsets: ["latin"], weight: ["400", "600", "700"], style:
  ["normal", "italic"], variable: "--font-soul-story" });
const sans = Plus_Jakarta_Sans({ subsets: ["latin"], weight: ["400", "500", "600",
  "700"], variable: "--font-soul-sans" });
const script = Caveat({ subsets: ["latin"], weight: ["400", "700"], variable:
  "--font-soul-script" });

export const metadata: Metadata = {
  title: "Soulprint - Memories Live On",
  description: "A warm digital home for stories, photos, voices, family records, and
    remembrance.",
};

export default function RootLayout({ children }: { children: React.ReactNode }) {
  return (
    <html lang="en">
      <body className={` ${display.variable} ${story.variable} ${sans.variable}
        ${script.variable}`}>
        {children}
      </body>
    </html>
  );
}
```

Run and verify

```
npm install
npm run lint
npm run dev
```

7. Starter Component Example

This example uses the optional CSS utility classes included in `soulprint.components.css`.

```
export function SoulprintHero() {
  return (
    <section className="sp-page px-6 py-20">
      <div className="mx-auto max-w-6xl sp-card">
        <p className="sp-eyebrow">Soulprint - Memories Live On</p>
        <h1 className="sp-hero-title mt-4">
          Build one beautiful <span className="sp-gradient-text">Soulprint
            Home</span>.
        </h1>
        <p className="sp-story-copy mt-6 max-w-2xl">
          Preserve stories, photographs, voice notes, milestones, and the little
            details that keep a life close.
        </p>
        <div className="mt-8 flex flex-wrap gap-3">
          <a className="sp-button-primary" href="/create">Create a Soul Profile</a>
          <a className="sp-button-secondary" href="/about">Learn More</a>
        </div>
        <p className="sp-parent-endorsement mt-10">Created by Chasdo Creative
          Worldwide LLC</p>
      </div>
    </section>
  );
}
```

Design direction

- Lead with Soulprint and the tagline before explaining features.
- Use simple cards for Soul Profiles, photos, voice notes, letters, family records, and long-term preservation.
- Keep the emotional tone loving, hopeful, respectful, and human.
- Do not make the product gray, sterile, cluttered, or corporate-generic.

8. Implementation Checklist

Check	What to verify	Pass condition
Files imported	Global CSS imports tokens and components.	No missing import errors.
Fonts loaded	Layout includes Cormorant Garamond, Fraunces, Plus Jakarta Sans, and Caveat or Allura.	Hero and UI text use the intended font feel.
Tailwind mapped	Config includes Soulprint colors, fonts, shadows, radius, and gradients.	Classes like bg-soulprint-pink work.
Contrast	Long text uses navy or ink, not bright accent colors.	Body copy is readable on ivory or white.
Brand copy	Footer/endorsement uses parent company line correctly.	It says Created by Chasdo Creative Worldwide LLC.
Product naming	Profile naming is consistent.	Use Soul Profile primarily; Soulfile as branded alternate.

Final note

This token system is intentionally vibrant. Use warm ivory as the base, navy for readability, then confident pink, coral, teal, cobalt, and gold accents with discipline.
